Titan Laser Treatment

The Titan laser treatment is a cutting edge procedure that helps patients achieve more youthful, tighter and healthier looking skin. As people age, one of the most common skin complaints is sagging, loose skin. Even women and men who do not have substantial wrinkles can suffer from sagging skin, which cannot be treated with traditional wrinkle-reducers like Botox or fillers like Restalyn, collagen or Juvederm. The Titan laser treatment is an ideal solution for people with sagging or loose skin. The Titan laser treatment works by targeting the collagen production below the top layer of skin, stimulating it to multiply and create firmer, tighter skin from within. Unlike Botox, Restalyn or Juvederm, the Titan laser treatment enables the body to naturally repair itself to create more youthful skin. Also, unlike these temporary treatments, the Titan laser treatment will have improved results over the course of time as the collagen continues to grow. Other treatments will fade away and require constant upkeep, making them more expensive in the long term.

The Renaissance Laser and Vein Institute is proud to be one of the leading Southern California laser centers to provide the Titan laser treatment. Since the Titan laser treatment is a fairly new technological advance, many clinics have been slow to adopt this exciting laser. One of the biggest benefits of the Titan laser treatment is its versatility; it can treat everything from a sagging neck and jowls to stretch marks anywhere on the body to loose abdominal skin after weight loss or pregnancy.

Titan Procedure™ - Non-surgical Facelift

Titan™ procedure is a revolutionary new technology from Cutera which facilitates the tightening of the skin through a non-surgical, non-ablative procedure. Using infra-red light, the Titan delivers controlled pulses of infra-red light to the skin, creating precise, deep dermal heating, while limiting the penetration depth of the heat to the deeper tissues. This dermal heating is a highly effective and safe method for tightening the skin, stimulating collagen production and remodeling, leading to a more youthful appearance.

During the Titan procedure, the epidermal layer is constantly cooled, making the process virtually pain-free. In fact, there is no need for any general or local anesthesia, and many patients report that the procedure actually feels soothing. Some patients report mild irritation or redness following treatment, but this usually subsides within a few hours without any treatment.

One of the best aspects on Titan™ laser treatment is that, unlike more conventional treatments such as injectable fillers in which the improvement is nearly immediate followed by slow degeneration, the improvements brought by Titan™ are slow and gradual, and in most cases actually improve over time. Most people begin to see subtle changes immediately after the first treatment, but after the third or fourth treatment the improvement is marked. Also, as the Titan™ works by stimulating the body to "heal" itself, the changes to your skin continue to improve for as long as six months, and the results can last for up to two years, though individual results will vary.

Unlike Thermage® treatments which can be very painful and require anesthesia, the Titan Procedure™ requires only a thin layer of aloe gel to be rubbed on the skin prior to treatment to allow freer movement of the laser head.

The Renaissance Laser and Vein Institute is the first center in the Conejo Valley to offer the Titan Procedure™, and is one of a very few sites in Southern California where this technology can be accessed. For maximum skin enhancement, some of our patients may benefit from our revolutionary 3-D Skin Rejuvenation treatment, combining the Titan Procedure™ with IPL Photofacial™ and Laser Genesis treatments. Also, all of our patients will benefit by utilizing our specialized skin care products, specifically designed to treat patients of laser procedures.

Titan Skin Tightening

The cutting edge new Titan laser is the most promising treatment for patients who are seeking skin tightening. Without going under the knife, the Titan skin tightening laser utilizes the power of infrared light to create tighter, smoother and younger looking skin. The Titan skin tightening treatment works by penetrating deep into the skin's layers to where collagen is formed. With its special infrared light, the Titan skin tightening treatment targets skin cells below the surface to rejuvenate and promote re-growth. This enables skin to repair itself naturally over the period of a few months, until the Titan skin tightening procedure can achieve its full effect. The great thing about the Titan skin tightening treatment is that patients can enjoy dramatic skin tightening effects without having to undergo anesthesia, scarring, invasive surgery, or long recover times. Patients can receive a Titan skin tightening treatment and go home or back to work immediately following the procedure.

The convenience, speed and results of the Titan skin tightening treatment make it an attractive option for today's busy moms and professionals. No matter how healthy you eat and the quality of skin care products you use on your face, once skin begins aging at a deep cellular level there is not too much that can be done to stop the process. The Titan skin tightening treatments are the least-invasive way to effectively target sagging, loose skin, and luckily can be used all over the body and the face. The versatility of the Titan skin tightening treatment enables it to work wonders on stretch marks, sagging skin, post-baby bellies and underarm flab. For people who have recently lost weight, women who have had children, and for those who want to fight gravity as they age, Titan skin tightening is a great option for more youthful, attractive skin.

Contact one of the surgeons at the Renaissance Laser & Vein Institute today to set up a consultation to determine if the Titan Procedure™ may help achieve your goals.
